

# Bale grazing in northern Southland - experiences to date

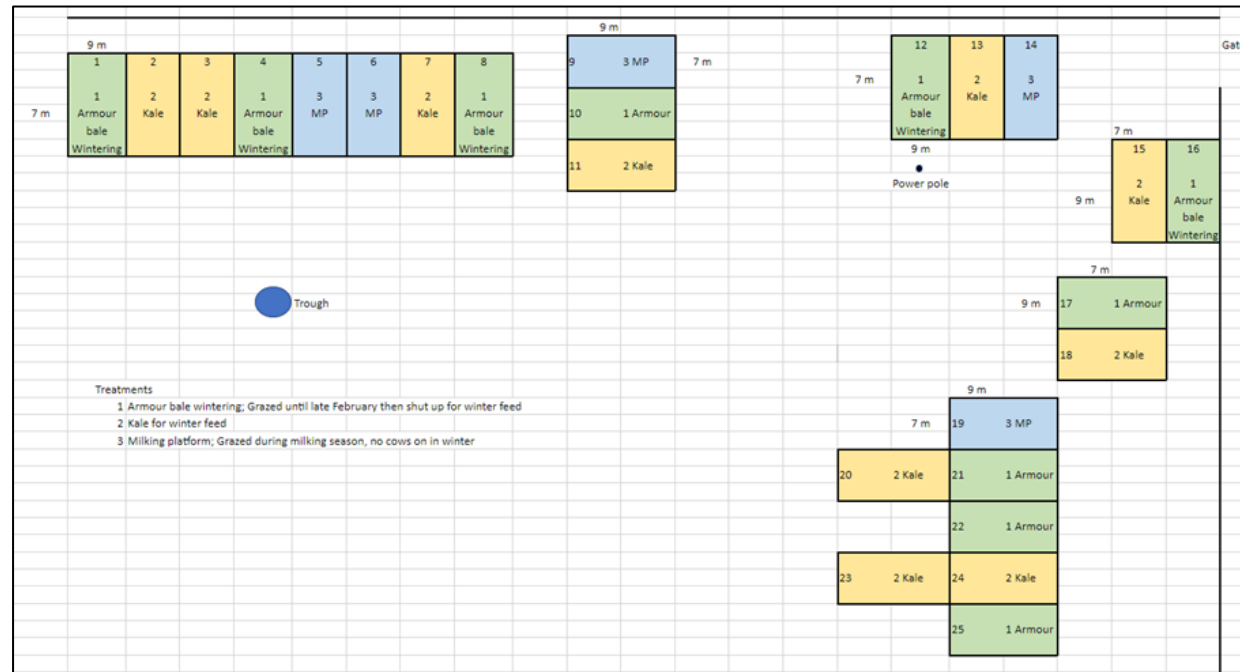

## Project objectives

- Quantifying the effects of a bale grazing wintering approach on environmental, animal welfare and GHG outcomes
  - ‘soil armour’ management practices
  
- 1) **Soil and water quality** (2021, 2022 and 2023)
- 2) **Animal welfare** (2022)
- 3) **Nitrous oxide emissions** (2022)

# Approach

**Well-drained soil**

Ceramic cup soil solution samplers used to measure N losses in drainage

## Two treatments:

### Bale grazing v kale wintering

16 m<sup>2</sup>/cow/day

0.5 RSU/m<sup>2</sup>/d

Offered:  
5.5 kg pasture DM/cow/d  
17.5 kg hay “

*(RSU = Relative Stock Units)*

8 m<sup>2</sup>/cow/day

1.0 RSU/m<sup>2</sup>/d

Offered:  
12.5 kg kale DM/cow/d  
4.5 kg baleage “

# Return of ground cover post winter grazing (2021)

# Soil and plant conditions post winter grazing - bale grazing plots (2021)

- Immediately after grazing on 17 June

- 41% bare soil 1 month after grazing

<10% bare ground  
2.5 months after  
grazing

# Welfare key findings

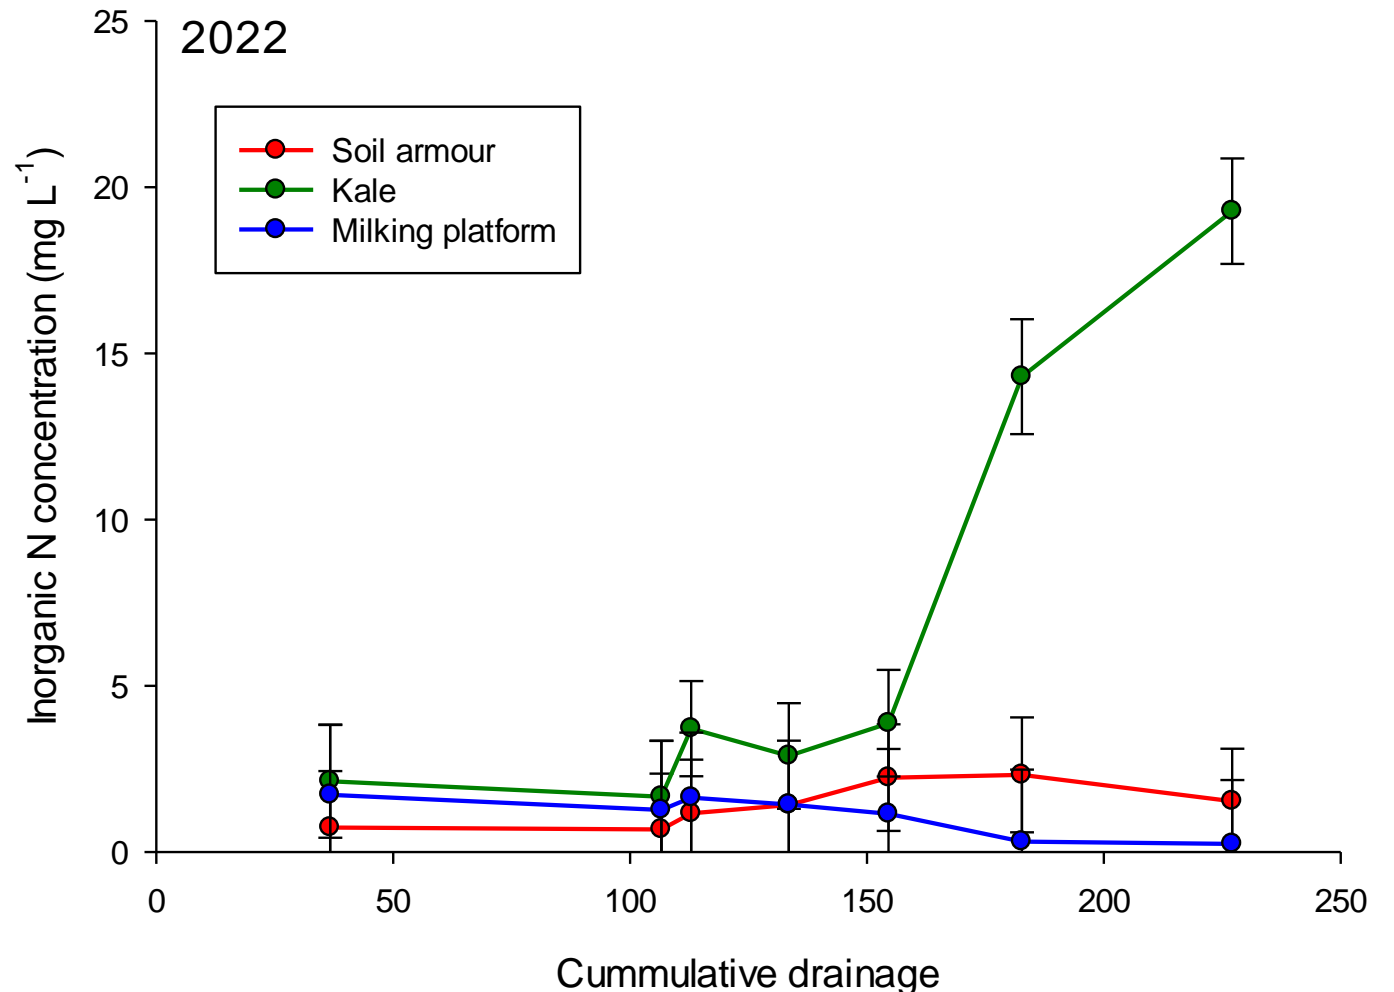

- Bale grazed cows had greater cow comfort:
  - Spent more time lying (on day one) and in postures indicative of greater thermal comfort
  - Spent more time ruminating
  - Were warmer (skin temperature) and cleaner
- Lying behaviour varied with weather conditions
  - Crop cows more variable in their response to weather including rebound responses
- Long term physiological impacts?
  - Potential changes in energy mobilisation (NEFA), thermo-regulation (T4), health & immune function (RBC, WBC) (descriptive data only)

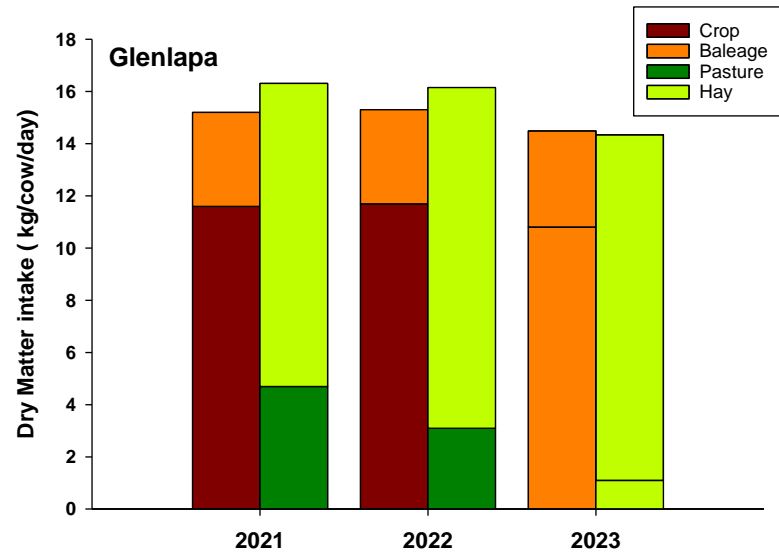

## Results: N concentrations in drainage at Glenlapa

- Lower N concentrations in the Bale Grazing (“Soil Armour”) treatment for all events in 2022.
  - N leaching loss approx. one quarter that estimated for kale treatment (per cow wintered)

# Animal intakes

## Dry matter intake

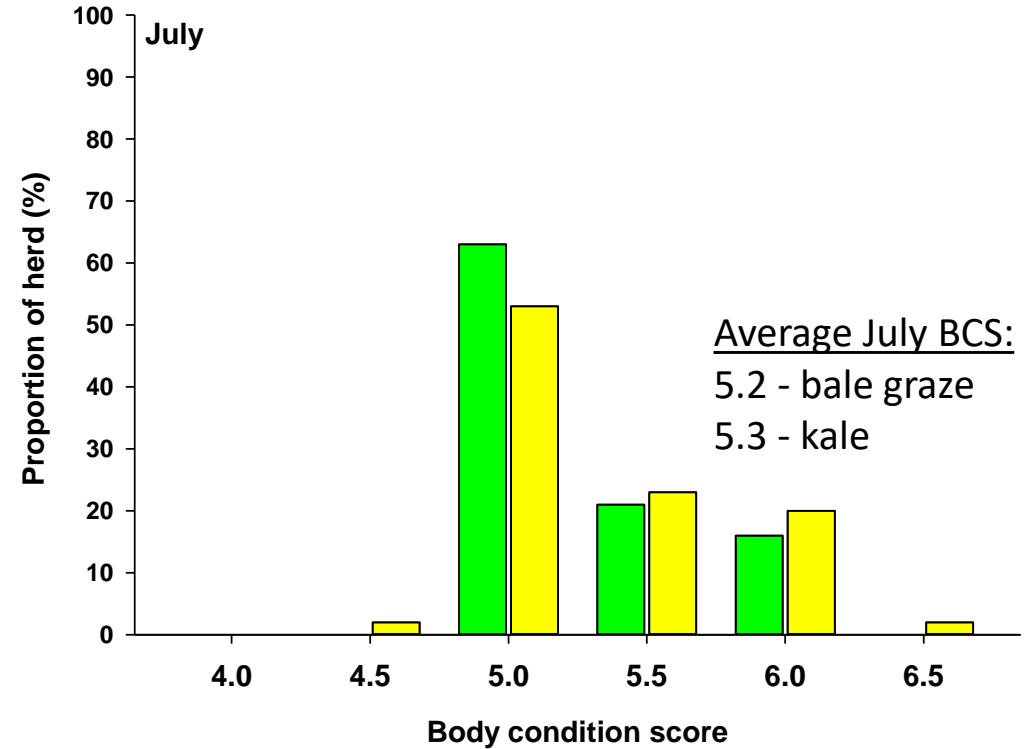

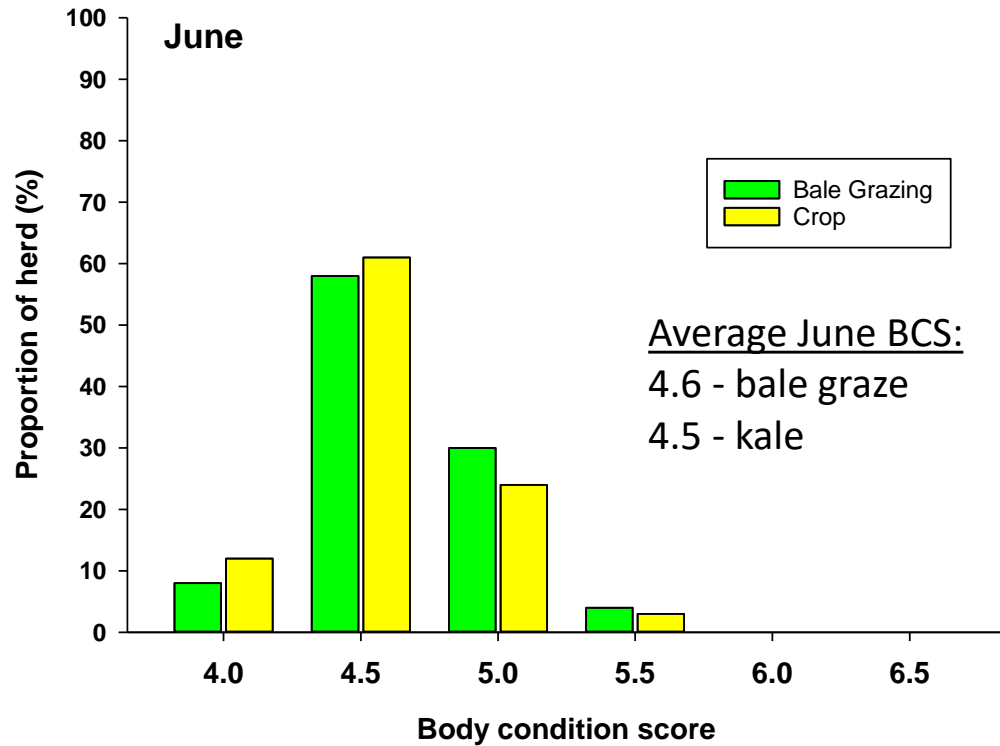

## ME Intake

## Protein intake

# Effect of bale grazing on body condition score Glenlapa, 2023

## Some key observations to date - bale grazing v kale wintering

	Kale	Bale grazing
October plant cover, kg DM/ha	minor weeds	~ 3,000
Plant N uptake by mid Oct, kg N/ha	minor	49
N leaching (2022), kg N/cow wintered	0.90	0.24 ↓ 74%
Soil damage		
- surface roughness, % increase	8.8	2.0
- VSA score	6.0	16.0
Soil loss risk		
- T/ha/yr	1.6	0.13
- T/cow wintered	0.09	0.01
Nitrous oxide emissions, kg N/cow wintered	0.33	0.11 ↓ 68%

## Design ingredients that have probably provided benefits in the bale grazing treatment:

1. Lower grazing pressure (16 v 8 m<sup>2</sup>/cow/day)
2. More soil armour/strength provided by established pasture
3. Well-drained soil (and dry-ish winters @ 150 - 200 mm rainfall)
4. Reduced cow trafficking/milling due to
  - Loafing surface provided by residual hay
  - 3-day breaks at a time?

Extra slides if needed

## Data collection – plant, water, soil, climate, animal

- Plant: Annual yields and N contents; winter forage allocations, quality & N contents; winter feeding residuals.
- Water: **drainage volumes; drainage N concentrations** per event (~25 mm)
- Soil: % bare ground v vegetated; pug depth; surface roughness; macroporosity & bulk density<sup>\*</sup>; aggregate size distribution<sup>#</sup>; infiltration rate<sup>+</sup>; nitrous oxide emissions
- Climate: rainfall; soil and air temp
- Animal: grazing pressure, RSUs m<sup>-2</sup>d<sup>-1</sup>; various welfare assessments

\*measured in 2021; #measured in 2022; +measured in 2022 at Glenlapa site only; RSU = Relative Stock Unit

# Bare ground estimates using drone footage Winter runoff paddocks (end Sept)

## Bare ground estimates using drone footage Bale-grazed winter runoff paddocks (as at 1 Oct 2022)

	Northern Southland winter pastures n = 8	South Otago winter pastures n = 17	Southern Southland winter pastures n = 3
% bare ground	49	43	44
% green	42	43	39
% bale area	10	14	17
